Teaching   Total   - Lectures:   - Tutorials:	Title of Course		Low level programming			
Hours per Course:   60   30   30   30	Semester		Spring			
ECTS Credits  The content of education  The aim of the course is to acquire knowledge, skills and social competences in the field of; computer operation at the processor and memory level, creating programs in C and assembler languages, using knowledge about the operation of the computer processor and memory to optimize programs, recognizing and fixing problems with programs written in low-level programming languages.  Program  Lectures:  • CISC assembler (x86 family (32- and 64-bit for Linux systems)  • RISC assembler (Atmel AVR family (8-bit, modified Harvard architecture), Arduino platform)  • RISC assembler (ARM family (32- and 64-bit), Raspberry Pi platform)  Tutorials:  • Pointers. Pointer operations. Dynamic memory allocation.  • Memory management methods. Implementing different memory management strategies. Custom allocators. Detecting and fixing memory leaks. Using valgrind tool.  • Creating multi-file projects. Build scripts. Make and cmake tools.  • Detecting memory errors and undefined behavior.  Optimizing programs.  Conditions of completion  Lectures: test with closed questions; +1 for correct answer, -1 for wrong answer, 0 for leaving question unanswered (minN points, max. +N points). Openended questions are also possible, scored depending on the level of difficulty of the question (min. 0 points, max. M points).  > 86% of N+M: A  > 72% of N+M: B  > 58% of N+M: C  > 44% of N+M: D  = 30% of N+M: E  < 30% F  Tutorials:  E od D - complete all small project during the semester. For better mark (from C to A) complete final project.  Final mark: average grades from lectures and tutorials (positive mark from A to E is required for both of them).	_		Total	- Lectures:	- Tutorials:
